

ELECTRONIC MAC 2 OVERBOOST KIT

COD.: CR1385E

Overboost Kit enhances response times and over power supply pressure on electronically controlled injection systems where the wastegate valve is supplied by a vacuum electropneumatic actuator. The kit consists of a vacuum regulator valve screwed up between the main and the wastegate vacuums (set by the factory; modify only if overpower supply values are too high). A turbo pressure emulator P.N. EP1 is connected to the system pressure sensor; it limits the reading, allows a boost not detected by ECU and determines an overpressure defect.
